Ex No: 9 Configuring Role-Based Access (Users, Roles and Permissions)

Pragadeesh - 240701388

1. Aim

To configure role-based access control in the Patient Appointment & Scheduling Management application so that the front desk, doctors and the administrator see only the data and components they need.

2. Procedure

1. Open the application in Edit mode and go to **Settings → User Permissions**. Note the default sets: Administrator, Read and Write.
2. Click **Add Permission Set** and create:
   - **Front_Desk_Access:** create and edit records in the form and reports, access to the Command Center page.
   - **Doctor_Access:** read access to appointments, edit access only to Consultation Status.
   - **Clinic_Admin_Access:** full access including export and settings.
3. Open **Settings → Users & Control → Roles** and create the hierarchy: Clinic Administrator → Doctor → Front Desk.
4. Open **Users** and invite team members, assigning each a permission set and a role.
5. Create a **Share Rule** so a Doctor can see only appointments where Doctor_Availability_Lookup is that doctor.
6. Set Share Rules and report-level access so Front Desk cannot view fee fields marked sensitive.
7. Log in as a Front Desk user and as a Doctor and verify what each can see and change.

[Insert screenshot: Test login showing restricted view]

3. Result

Users, roles, permission sets and share rules were configured, and access was limited to what each role needs.
