Ex No: 14 Exploring Pro-Code Extension of a Zoho Creator Application

Pragadeesh - 240701388

1. Aim

To extend the Patient Appointment application with a pro-code custom function, and to understand how low-code and pro-code approaches work together (Zoho Catalyst / Microservices).

2. Procedure

1. Open **Workflows → Functions → Create New Function**.
2. Enter the function name `cancelAppointment`, choose the category **Automation**, return type **void**, and add the argument `recordID` (BIGINT).
3. Write the function body:

```
void automation.cancelAppointment(int recordID)
{
    appt = Appointment_Booking_Form[ID == recordID];
    if(appt.count() > 0)
    {
        appt.Status = "Cancelled";
        sendmail [ from: zoho.adminuserid to: appt.Email_Address subject:
"Appointment Cancelled" message: "Your appointment " + appt.Appointment_ID +
" has been cancelled." ]
    }
}
```

4. Save the function and test it by passing a sample record ID.
5. Call the function from a report button or a workflow: `thisapp.automation.cancelAppointment(input.ID);`
6. Explore **Microservices** and Zoho Catalyst: write a custom backend function (Node.js, Java or Python) for heavy logic, expose it as an API, and call it from Deluge with `invokeurl`.
7. Study the execution flow: Creator action → Deluge function → optional Catalyst/microservice API → response back to the record.

[Insert screenshot: Saved function code]

[Insert screenshot: Execution result]

3. Result

A reusable custom function was created and called from the application, and the way pro-code extensions complement low-code development was understood.
