Ex No: 15 Career Pathways and Future of Low-Code Development

Pragadeesh - 240701388

1. Aim

To study career pathways in low-code development, the skills required, and the future trends of the field, using the Patient Appointment project as the reference.

2. Procedure

1. **Roles in low-code development:**
   - **Citizen developer:** builds simple forms and reports, like the booking form.
   - **Low-code developer:** builds workflows, approvals and Deluge logic, like the automation suite.
   - **Automation / process specialist:** designs processes such as the appointment lifecycle Blueprint.
   - **Integration specialist:** connects Creator to payment gateways and Zoho Calendar.
   - **Solution architect:** designs hybrid low-code and pro-code systems.
2. **Skills required:** platform knowledge (forms, reports, pages, workflows), Deluge scripting, data modelling, API and integration knowledge, security and governance awareness, and communication with clinic staff.
3. **Career progression:** Citizen Developer → Low-Code Developer → Specialized Developer → Solution Architect.
4. **Future trends:** AI-assisted application building (for example Zia), more automation, API-first and cloud-native platforms, closer collaboration between low-code and pro-code, and stronger governance.
5. **Three pillars of modern application development:** low-code for speed, automation for efficiency, and AI for smarter applications.
6. **Benefits seen in this project:** faster response to business needs, such as adding a new procedure type, and less manual work at the front desk.

3. Result

Career roles, skills and future trends of low-code development were studied, and it was concluded that developers′ roles will evolve rather than disappear as AI, automation, APIs and cloud technologies shape the field.
